

Creeping Buttercup (*Ranunculus repens*)

This is a creeping perennial plant most commonly found on heavy soils. It spreads by the production of long stolons. The plant flowers from spring to late summer and it presents well known yellow petalled buttercup flower head. Each leaf bears 3 lobes – upper lobe is stalked. These lobes are deeply toothed and hairy. Creeping Buttercup can be a serious problem if neglected.

THE CONTROL best managed with hand weeding though applications of fluroxpyr, clopralid and MCPA.
