

Speedwells (*Veronica spp.*)

Several types of speedwell species invade home lawns. Some are annual plants that reproduce from seed and others are perennial plants that can reproduce by seed, rhizomes and creeping stems. All are low growing with small leaves. Perennial species are generally more difficult to control.

CONTROL: a combination of proper cultural practices, adequate nutrition and a progressive weed control program that may include repeat applications of government regulated weed control materials will help to control these weeds over time. It may require several years of effort by a lawn care professional and the homeowner before adequate control of these weeds is achieved.
