

FERTILISER PROGRAMME

Benefits of using a fertiliser programme

- To achieve maximum continuity which will increase and maintain plant count all year round.
- By increasing the hardiness and stress tolerance of the turf you will be able to carry out more aeration /scarification to keep thatch to a minimum, which reduce disease and cut down costs.
- If your root zone has a deficiency, this can be included into the programme and rectified.
- To feed all year round, which will increase winter hardiness and spring start up.
- Increase continuity and better plant count will allow you to reduce the height of cut, which will increase the performance of your fine turf.
- Allow you to budget an overall cost per green/area per year

The Weed Man Fertiliser Program

A Weed Man fertiliser program will feed your lawn 3-6 (depends on location) times a year at approximately 6-10 week intervals. Weed Man uses only the highest quality products, which have been specially developed for home lawns. As you can see, Weed Man fertiliser contains a small percentage of fast release fertiliser that is immediately available to your lawn. Larger quantities of slow release nitrogen will become available to the lawn as it needs the nitrogen. Weed Man fertiliser also contains phosphorus, potassium and soil conditioners. Combined with proper mowing, watering, aerating and weed control (and in the absence of disease and insect problems), Weed Man's fertiliser program will give you a healthy lawn all season long.
